Kunci jawaban kuantasimanagerialhansenmowenedisi8buku243

A: As I said in my comment, your code doesn't match the output you are getting, so the rest of my answer is based on your comment: I have matched the different "pattern" and I'm able to change each of the line numbers. So I know that each of the lines is a result of something being printed, but I'm not exactly sure what. OK, first of all, I wouldn't worry so much about concision. That's up to your preference, but I would prefer having something like the following: `/((\S+)\s{12}.*)\s{12}\s{2,}/` That is: A capturing group (normal parentheses, [...]) Then a quantifier of some kind of repetition operator ([...]+), or + Then a quantifier for a space ([\s]+), or just a single space Then a quantifier for the second type of line you're looking for (with optional spaces on either side, [-\s]+\h*), or a regular expression literal \h* Next, because you're using a capturing group, and your patterns are extremely similar, I would look at reducing the number of groups: `/([\S\s]*)\h*(\S\h*)+/g` This matches each line, and stores it in the captured group. You could use a loop to store the captured lines and then break out with the value of your last non-whitespace captured group, or you could count the number of times a particular string matches: `/([\S\s]*)\h*([\S\h]*){,2}/g` Now you would only need to compare the 2nd captured group. (You could also build up the pattern with more non-capturing groups.) Next, I would consider storing the lines in a 2D array, or maybe look into an array generator. Next, a different strategy would be to use a try..catch with a multi-line regex. And finally, capturing groups are not always the best tool for the job. Unless you are using this pattern to determine whether to include the match in a specific set of text, you should be looking for a different method of capturing the information. However, if 3e33713323
