Two monodentate Schiff base ligands (L1 and L2) were synthesized and characterized by IR, UV-vis, MS and ¹H NMR spectra. The complexes of Cu(II) with the ligands were prepared and characterized by IR, UV-vis and electronic spectra. The results indicated that complexes are green, and the electronic spectra show that they have two absorption peaks at 446 and 592 nm. In addition, the result of X-ray diffraction showed that the compound L2 has a more planar structure than the compound L1.

That's right - horror. It's a series about people going on vacation to the places where horrible things happen. You're going to love it - trust me. In the meantime, I don't think I'll ever be able to actually
