A desktop AutoCAD Product Key drawing shows the Drafting and Annotation panel. A drawing is a document made in CAD software such as AutoCAD. CAD software, such as AutoCAD, is used to draw architectural, mechanical, electrical, plumbing, and other engineering designs. The drawings produced in a CAD program are permanent and usually cannot be altered. Digital drawings are typically in the vector (line, spline, and area) or raster (bitmap) image file formats. AutoCAD is mostly used for technical drawings of products and structures but it also can be used for architectural, mechanical, and electrical designs. The AutoCAD file format has been revised several times since its introduction. Its file name extension is .DWG and the company logo at the end of the file name extension indicates that the file is a "drawing" or "dynamic web drawing" file. To meet the demands of users, the number of features and data structures included in the file format has increased with the number of applications using AutoCAD. In 1989, the file format was changed to support transparency. The user interface was improved in 1992 when the drawing area was separated into Drafting and Annotation windows, and the built-in drawing tools such as Line, Arc, Polar, and Translate were incorporated into the top of the screen. AutoCAD 2002 (rev. 13.0) introduced a new type of layer and file format called "Dynamic Web" (DWG). The layers in DWG files are dynamic in the sense that they can be named, named groups, and used to store attributes. This is a major improvement over the previous standard file format (DWG-II) that can only support layers that have a fixed name. In 2005, AutoCAD 2007 added support for transparent layers that allow the layer to be used for displaying and editing the drawing. A layer can be used as an XREF or cross-reference layer by drawing a line or arc at a location in the drawing where the reference information resides. If an XREF layer is used in a DWG file, the XREF data must be written directly to the file and there is no mechanism for updating the XREF data in the file. In 2007, AutoCAD 2007 introduced the DWG viewer, which is a viewer for viewing the Autodesk DWG file format. This viewer is

Filter View The Filter View is a view that lists all objects in a drawing, layer, and/or drawing set, such as the list view that appears when a user presses the Shift + F2 keyboard shortcut. The Filter View is displayed when the user first opens the drawing or creates a new drawing. The Filter View can be replaced by the Filter Toolbar. This view is automatically refreshed when you select and deselect items from the drawing. The Filter View contains checkboxes, so you can select or deselect individual layers, objects, or attributes. The Filter View's search bar is the fastest way to search for any attribute or layer. However, the Filter View can't search for items that aren't visible in the drawing, like closed splines. You must also press the Enter key to add objects to the filter. You can search for objects or attributes using the Edit Search bar. The Edit Search bar also enables you to enter text and get instant results when searching. You can also edit the AutoCAD database directly by typing in the Query text box. Queries are similar to Filter Views, but you can enter the letters of any attribute to find the object you want. You can select an object and edit it directly in the Filter View, and you can also modify the object's settings. The Filter View can help you manage your drawing's objects and attributes. It also enables you to find any object that matches any part of any search. You can open the Filter View by selecting View > Filter View in the menu bar or pressing Shift + F2. You can also open the view by selecting View > Filter View in the command bar, or by pressing Ctrl + F2. To open the Filter View in your drawing, you must first have the Autodesk Exchange Apps (available on the Application Store), or make sure that you've added the Exchange to your drawing. The Filter Toolbar provides access to the Filter View, and to the Filter Toolbar Options dialog box, where you can specify filters and filter views. Filter Toolbar The Filter Toolbar is a toolbar that contains the most commonly used filters. You can open the Filter Toolbar by pressing Alt + F4. To find any object that matches a search, the Filter Toolbar uses both the Filter View and the Edit Search bar. The Filter Toolbar contains three options: Show All by default is the first option. af5dca3d97
